

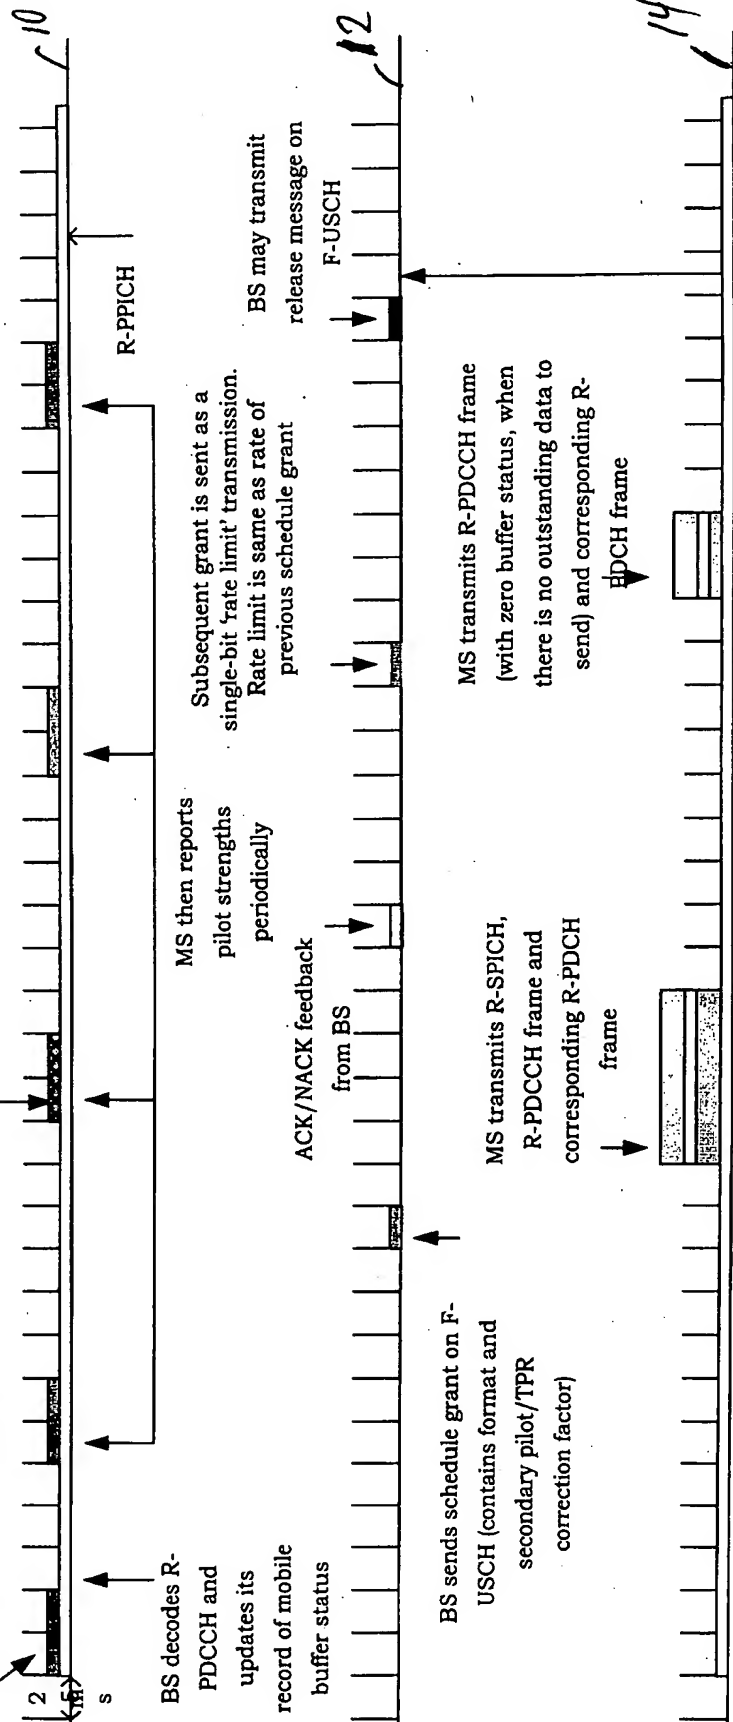

Fig. 1

Pilot report is pre-empted by scheduled transmission

After entry into scheduled mode, MS transmits R-PDCCH asynchronously to notify BS of non-zero buffer status (and concurrently makes the first pilot report update)

MS halts periodic reporting of pilot updates (until data arrives in buffer, at which point it makes an asynchronous transmission of R-PDCCH)

R-SPICH power corresponds to format contained in F-USCH (format, secondary pilot correction factor)
